

INTRODUCING, OYSTERWOOD

Oysterwood is end grain cut veneer from high quality timber. Traditionally, wood veneer is cut horizontally along the tree but this creative process slices the veneer vertically along the end instead. After the tree is cut, the resulting logs are sliced into sheer, precise discs and staggered to give a hint of style to any given surface. The outcome shows the annual growth rings of the tree.

End grain cut veneer is very natural in aesthetic showing the structure and character of the wood design down to the color and grain of each piece. Each design has a very pleasing mosaic feature that adds beauty to any project.

We currently offer 14 design variants of Oysterwood.

SIZE: Approximately 4' x 8'

THICKNESS: 1.0 - 1.5 mm
